

# SALES LIFECYCLE.

|          |                             |
|----------|-----------------------------|
| ROLE     | Lead Product Designer       |
| SURFACES | PRO · Mobile / OS · Desktop |
| SCOPE    | Discovery → Final Design    |

Final operating model: order health connects commercial targets to purchase orders, procurement agents, suppliers, and warehouses.

## One order. Two operating contexts.

Sales Order sits between demand capture and operational execution. PRO users need quick status recognition and obvious next actions in the field. OS users need comparison, commercial control, ownership, approvals, and downstream traceability at scale.

### The order was visible. The decision system was not.

Status, price, margin, approval, procurement, and fulfilment were interdependent, but each role needed a different level of detail. A universal screen would either overwhelm mobile users or underserve desktop operators.

### Make the lifecycle legible and commercially accountable.

- Create one shared status model across PRO and OS.
- Structure margin assessment before approval.
- Expose ownership and the next responsible action.
- Connect approved orders to fulfilment performance.

## Design evidence revealed where the workflow carried risk.

Screen and workflow synthesis identified five recurring needs: lifecycle state as navigation, margin as a multi-step workflow, persistent order context during commercial decisions, visible exception handling, and post-approval traceability.

Evidence boundary — no interview repository, analytics baseline, or production KPI set was supplied. Business impact below is framed as an expected outcome to validate, not a measured claim.

PRO v1 — status-led mobile triage.

Final PRO — exception visibility and explicit action.

## A shared lifecycle became the product spine.

01

### Request

Capture buyer, commodity, quantity, location, and fulfilment expectations.

02

### Margin

Model delivered cost, allocation, recovery, payable days, and expected margin.

03

### Approval

Route margin and risk decisions to accountable approvers.

04

### Modify

Return commercial exceptions with a visible reason and next action.

05

### Fulfil

Connect purchase orders, procurement agents, suppliers, and warehouses.

06

### Complete

Track actual versus expected outcomes through order completion.

# From status visibility to operational control.

The design evolved in five moves: establish the mobile lifecycle, turn the desktop list into an operational queue, isolate the high-risk margin decision, extend visibility beyond approval, and align final PRO and OS semantics.

OS v2 — structured margin allocation and validation.

## Role-aware surfaces, shared commercial semantics.

### PRO

#### **Recognition before density.**

Search, lifecycle tabs, compact order cards, exception banners, and mobile-first actions.

### OS

#### **Control before simplicity.**

Owner filters, dense comparison, margin inputs, approvals, mapped entities, and variance views.

### SHARED

#### **One source of operational truth.**

Consistent identity, status, quantity, commodity, ownership, and action language.

## 11 · CHALLENGES

The core trade-off was semantic consistency versus interface sameness.

PRO and OS deliberately do not look identical. Consistency lives in the lifecycle and object model; interaction density changes with role, device, and decision risk.

## 12 · RESULTS

A capability outcome, pending metric validation.

The final design creates structured margin review, explicit approval and modification states, visible ownership, and entity-level fulfilment traceability. Production impact still requires instrumentation.

## 13 · FUTURE OPPORTUNITIES

Instrument the workflow before redesigning it again.

Next: decision history, margin-variance explanations, scenario comparison, risk-based prioritisation, cross-platform deep links, accessible data-density controls, and lifecycle KPI instrumentation.
